

CLAIMS

1 1. A hydrogen generation apparatus comprising:
2 a boiler;
3 a pump delivering a feedstock into said boiler;
4 a reactor for producing hydrogen from said feedstock;
5 a burner in thermal communication with said reactor, said burner receiving a
6 catalytically combustible mixture of feedstock and a combustible gas, said feedstock
7 being metered to said burner by a first control valve;
8 a waste gas outlet in full communication with said burner;
9 a reactor pressure sensor monitoring a reactor pressure within said reactor;
10 a second stage delivering a purified product gas to a product outlet and a
11 raffinate to a raffinate outlet;
12 a combustion gas inlet delivering said combustible gas to said burner; and
13 a computer controller receiving data from said first pressure sensor and
14 controlling said first control valve.

1

1 2. The apparatus of claim 1 wherein said purified product gas is
2 hydrogen.

1 3. The apparatus of claim 1 wherein said purified product gas is carbon
2 dioxide.

1 4. The apparatus of claim 1 wherein said raffinate outlet is in fluid
2 communication with said burner.

1 5. The apparatus of claim 1 wherein said feedstock is an aqueous organic
2 feedstock and said secondary stage is a water gas step membrane reactor.

1 6. The apparatus of claim 5 wherein said aqueous organic feedstock is
2 selected from the group consisting of: aqueous mixtures of -alcohols, -ketones, -
3 alkanes, -alkenes, -alkynes, -aldehydes and aliphatics.

1 7. The apparatus of claim 1 wherein said feedstock is ammonia and said
2 secondary stage is a flat plate heat exchanger operating as a purifier.

1 8. The apparatus of claim 1 wherein said reactor comprises a flat plate
2 heat exchanger having a lower channel passing reacting feedstock therethrough and
3 an upper channel passing heated gases therethrough in a direction non-concurrent
4 with flow in the lower channel.

1 9. The apparatus of claim 5 wherein said water gas step membrane
2 reactor is a flat plate heat exchanger having reactant channels containing catalyst
3 media therein and channels containing said purified gas product and having a purified
4 product permeable gas membrane therebetween.

1 10. The apparatus of claim 9 wherein the membrane is a metal alloy.

1 11. The apparatus of claim 9 wherein the membrane is a polymer.

1 12. The apparatus of claim 1 further comprising a heat exchanger
2 transferring heat between said purified product gas and said combustible gas.

1 13. The apparatus of claim 1 further comprising a second pressure sensor
2 monitoring a product gas pressure in fluid communication with said product outlet.

1 14. The apparatus of claim 1 further comprising a second control valve
2 metering said combustible gas to said burner, said second control valve responding to
3 signal generated by said computer controller.

1 15. The apparatus of claim 1 further comprising an oxygen sensor
2 monitoring oxygen content within said waste gas outlet and communicating the
3 oxygen content to said computer controller.

1 16. A process for forming hydrogen from a feedstock comprising the steps
2 of:
3 preheating a feedstock;
4 providing said feedstock to an exothermic reaction reactor;
5 allowing sufficient residence time for said feedstock in said reactor to
6 undergo an endothermic reaction to yield hydrogen and an endothermic reaction
7 product;
8 transferring said hydrogen and said endothermic product to a secondary stage
9 water gas step membrane reactor operating at a lower temperature than said reactor;
10 and

11 collecting from secondary stage a purified hydrogen flow and a rafinate gas
12 stream.

1 17. The process of claim 16 wherein said feedstock is preheated within a
2 pump supplied boiler.

1 18. The process of claim 17 further comprising the step of metering said
2 feedstock to a burner in thermal communication with said reactor so as to maintain
3 said reactor at a temperature promoting the endothermic reaction.

1 19. The process of claim 18 further comprising the step of monitoring
2 reactor temperature and communicating reactor temperature to a computer controller.

1 20. The process of claim 19 further comprising the step of monitoring
2 reactor pressure and communicating reactor pressure to said computer controller.

1 21. The process of claim 16 further comprising the step of combusting said
2 rafinate gas flow in said burner to yield a waste gas stream.

1 22. The process of claim 21 further comprising the step of heat exchanging
2 between said waste gas stream and said feedstock so as to preheat said feedstock prior
3 to said reactor.

1 23. The process of claim 16 further comprising the step of providing a
2 combustible gas flow to said burner.

1 24. The process of claim 22 further comprising the step of providing
2 feedstock to said burner so as to heat said reactor.

1 25. The process of claim 23 wherein said combustible gas flow is provided
2 stoichiometrically burn said rafinate.
